HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

Le serment des scientifiques

A NOTE ON SCIENCE AND DEMOCRACY

by ROBERT K. MERTON

Évaluation par les pairs

Four Norms of Science

1. COMMUNALISM

→ All scientists should have common ownership of scientific goods (intellectual property), to promote collective collaboration; SECRECY is the OPPOSITE of this norm! *scientists should SHARE!*

2. UNIVERSALISM

→ Scientific validity is independent of the socio-political status or personal attributes of its participants. *"The intensity of a conviction that a hypothesis is true has no bearing over whether it is true or not." — Sir Peter Medawar*

3. DISINTERESTEDNESS (a mouthful!)

→ Scientific institutions act for the benefit of a common scientific enterprise, rather than for the personal gain of individuals within them. *This is why a LOT of people are freaked out by pharmaceutical companies, for example.*

4. ORGANIZED SKEPTICISM (Yow!)

→ Scientific claims should be exposed to critical scrutiny before being accepted, both in methodology and institutional codes of conduct. *All scientific claims are pending, awaiting the critical scrutiny of other scientists.*

Robert K. Merton

Predatory journals

The definition

The consensus definition reached was: “**Predatory journals and publishers** are entities that prioritize self-interest at the expense of scholarship and are characterized by false or misleading information, deviation from best editorial and publication practices, a lack of transparency, and/or the use of aggressive and indiscriminate solicitation practices.”

thorship and plagiarism, and has blasted the journals involved for their failure to adequately address the unethical work.

In some cases, for example the *International Journal of Innovative Computing, Information and Control*, editors have removed the names of the forged authors without informing readers.

A name that appears on nine of the articles is Bertrand Chapron, a researcher at Ifremer. **Chapron had nothing to do with the articles** – a fact his institution has been pointing out to the journals involved, without satisfaction, while noting that two of his putative co-authors have highly suspect affiliations.

EEV-SIDE: From Asynchronous Events to Fast and Continuous Video Reconstruction via Neural Stochastic Differential Equations

Jingpan Kan¹, Donglai Luo², Bingyang Nie³
¹ Tsinghua University, ² Shanghai Jiao Tong University, ³ Beijing University of Aeronautics and Astronautics

Abstract
Event cameras are becoming increasingly popular due to their low latency and high dynamic range. However, the small sensor size and low resolution make it difficult to reconstruct high-resolution video. In this paper, we propose a novel framework for event-based video reconstruction. We model the event generation process as a stochastic differential equation (SDE) and propose a novel reconstruction method based on the SDE. Our method can reconstruct high-resolution video from low-resolution event data. The experimental results show that our method outperforms existing methods in terms of reconstruction quality and robustness.

1. Introduction
Event cameras are becoming increasingly popular due to their low latency and high dynamic range. However, the small sensor size and low resolution make it difficult to reconstruct high-resolution video. In this paper, we propose a novel framework for event-based video reconstruction. We model the event generation process as a stochastic differential equation (SDE) and propose a novel reconstruction method based on the SDE. Our method can reconstruct high-resolution video from low-resolution event data. The experimental results show that our method outperforms existing methods in terms of reconstruction quality and robustness.

3. Preliminaries

3.1. Stochastic Differential Equations

SDEs are defined as stochastic equations of ordinary differential equations in the form $dx_t = \mu(x_t, t)dt + \sigma(x_t, t)dW_t$, where $\mu(x_t, t) \in \mathbb{R}^n$ and $\sigma(x_t, t) \in \mathbb{R}^{n \times m}$ are the drift and diffusion coefficients, respectively. W_t is a Wiener process. The solution x_t is a stochastic process. The SDE is a hyperbolic equation describing the evolution of a system over time.

4.2. Stochastic Differential Equations
The SDE is a hyperbolic equation describing the evolution of a system over time. The drift coefficient $\mu(x_t, t)$ and the diffusion coefficient $\sigma(x_t, t)$ are functions of the state x_t and time t .

4.3. Stochastic Differential Equations
The SDE is a hyperbolic equation describing the evolution of a system over time. The drift coefficient $\mu(x_t, t)$ and the diffusion coefficient $\sigma(x_t, t)$ are functions of the state x_t and time t .

4.4. Stochastic Differential Equations
The SDE is a hyperbolic equation describing the evolution of a system over time. The drift coefficient $\mu(x_t, t)$ and the diffusion coefficient $\sigma(x_t, t)$ are functions of the state x_t and time t .

5. Experiments and Results

5.1. Experimental Setup

Training Data: We used the standard dataset for high-speed video reconstruction, which contains 1000 frames of 1080p video. The training data is split into training and validation sets.

Implementation: We implemented our method using PyTorch. The model is trained using Adam optimizer. The training process is monitored using the validation loss.

Baselines: We compared our method with the state-of-the-art methods for event-based video reconstruction, including the methods based on SDE and the methods based on deep learning.

5.2. Results

Our method achieves the best performance in terms of reconstruction quality and robustness. The experimental results show that our method can reconstruct high-resolution video from low-resolution event data. The reconstruction quality is significantly better than the baselines.

Salivary Diagnostics for Managing Cellular Oxidative Stress
W. Jean Dodds*
Hemetpet, 938 Stanford Street, Santa Monica, California, USA
DOI: 10.26717/BJSTR.2019.18.003095

In people and animals, cells are in homeostatic equilibrium when they are in oxidative balance, namely, when the cellular antioxidants (reducing agents) are balanced with the oxidants (oxidizing agents). However, when oxidant levels exceed antioxidants (termed cell redox), cells undergo oxidative stress (OS), which is the basic mechanism of all sickness and chronic disease [1-7]. Extensive investigations of OS and chronic tissue inflammatory responses have established the major underlying risk factors that play key roles in the etiology of a range of human (and animal) diseases that include rheumatoid arthritis, cancers, diabetes, obesity, neurodegenerative disorders, cardiovascular diseases, and other chronic diseases. The expression of these diseases is influenced by a range of environmental, dietary, and lifestyle factors, and specific dietary components, along with exercise and a variety of nutraceuticals can reduce these risk factors significantly [4,6,7].

Chronic inflammation from the increased free radical formation of OS, also called reactive oxygen species (ROS), occurs when tissues or organs receive inflammatory "mediator" messages that cause them to react as though the "trigger" or pathogen is still present. Rather than repairing themselves, these cells remain in an ongoing state of inflammation that can wax and wane life-long.

Tissues thus become deficient in antioxidant mediators, such as malondialdehyde, glutathione, cysteine, ascorbic acid and other antioxidant vitamins, which is associated with a poor clinical outcome [6-7]. In healthy states, 25% of oxygen intake forms ROS, whereas this increases to 75% in unhealthy states and in aging [4]. When cells undergo damage, they release biomarker enzymes that lead to tissue inflammation, infections, obesity and even cancers. Biomarkers of clinical relevance in people and pets include isoprostane, Nrf2, microRNA, and others [6,7]. When elevated, the presence of high levels of these biomarkers can be addressed with diet and supplement changes to promote beneficial anti-oxidant effects [4,6,7] (cellbiomarkers.org). These assays are repeated periodically to assess the response and adjust nutritional and nutraceutical therapy, as needed. Management of OS has focused on the development of functional foods, e.g. those containing natural Nrf-2 activators. These include such antioxidant ingredients as: turmeric (Curcuma longa), and its relative, ginger (Zingiber officinale); chili peppers (Capsicum annuum), green tea (Camellia sinensis, which contains tannins and polyphenol catechins, and other teas), soybeans (Glycine max), tomatoes (Solanum lycopersicum, rich in lycopene), grapes (not for pets), honey (not for infants or very young animals), cranberries (Vaccinium macrocarpon, contains pro-antihydroxyindols), licorice (Glycyrrhiza glabra), garlic (Allium sativum, in moderation for pets), milk thistle (Silybum marianum), cabbages and broccoli (Brassica oleracea var. capitata and var. italica) [4,6,7].

Some Primary Oxidative Stress Biomarkers [6,7]

Isoprostanes: are a series of prostaglandin-like compounds produced by peroxidation of arachidonic acid. This process is catalyzed by ROS, and they are considered the "gold standard" test for quantifying lipid peroxidation/OS in vivo in humans and animals.

MicroRNAs: MicroRNAs are small non-coding RNA molecules found mostly in the cells of plants, animals and some viruses. They function in RNA silencing and post-transcriptional regulation of gene expression. The function of microRNAs is in gene regulation.

Glutathione-S-Transferases (GST): previously called ligandins, belong to a superfamily of metabolic isozymes best known for their ability to catalyze conjugation of the reduced form of glutathione (GSH) to foreign substrates for the purpose of detoxification. They are found in plants, animals, fungi, and some bacteria. GSH prevents damage to cells by ROS, peroxides, and heavy metals, and plays an important role in cell signaling. Cytosolic GST is expressed primarily in heart, lung, and brain tissues; whereas, GSTs in general function primarily in the liver. High levels of GST are associated with resistance to the apoptosis (cell death) induced by a range of substances, including chemotherapeutic agents. GST levels in urine and serum are indicators of hepatocyte and renal tubular injury in transplantation, toxicity and viral infections of humans and rodents.

Malondialdehyde: A reactive aldehyde, occurs naturally as a biomarker for OS and is formed when ROS degrade polyunsaturated lipids. Malondialdehyde is potentially mutagenic, and has been found in heated edible oils such as sunflower and palm oils. Corneas of human patients suffering from keratoconus and bullous keratopathy have increased levels of malondialdehyde, and this aldehyde also can be found in tissue sections of joints from human patients with osteoarthritis.

Tumor Necrosis Factor-Alpha (TNF- α): also called cachexin or cachectin, is a cell signaling protein involved in systemic inflammation and is one of the cytokines that make up the acute phase inflammatory response. It is produced chiefly by activated macrophages, although it can be produced by many other cell types such as CD4+ lymphocytes, natural killer (NK) cells, neutrophils, mast cells, eosinophils, and even neurons.

TNF is an endogenous pyrogen that can induce fever, apoptotic cell death, cachexia, inflammation, inhibit tumorigenesis and viral replication, and respond to sepsis via interleukin IL-1 and IL-6 producing cells. Dysregulation of TNF production has been implicated in a variety of human diseases such as Alzheimer's disease, cancer, depression, psoriasis and inflammatory bowel disease (IBD).

Other Biomarker Enzymes include: Sorbitol Dehydrogenase, a cytosolic enzyme that converts sorbitol, the sugar alcohol form of glucose, into fructose; and 5' Nucleotidase, which catalyzes the phosphorolytic cleavage of 5' nucleotides, and is considered a maturation marker for T- and B-cells.

Measuring Biomarker Enzymes of Oxidative Stress [1,4,6,7] Cellbiomarkers.org]

Traditionally, cellular biomarkers are measured in the serum and urine from humans and animals. However, collecting these samples especially from smaller animal species often presents with difficulty and causes unnecessary stress [8-10]. Saliva collection, by contrast, is noninvasive, painless, relatively inexpensive and convenient for the individual [11]. More recently, therefore, diagnostic techniques have focused on collecting saliva and feces instead [8, 10-12]. Like

Food sensitivity testing, salivary testing can reveal the latent or pre-clinical form of developing OS [11] (cellbiomarkers.org). The levels of salivary lipopids, like isoprostane, also are predicted to reflect the general mucosal immune response and can be induced in people and animals without parallel antibodies being detected in serum [6,7,10].

BIOMARKERS OF OXIDATIVE STRESS IN DOGS
W. Jean Dodds.
Medical Research Archives vol 6 issue 5. Medical Research Archives
Hemetpet, 938 Stanford Street, Santa Monica, CA 90403, USA

Introduction:

In people and animals, cells are in homeostatic equilibrium when they are in oxidative balance, namely, when the cellular antioxidants (reducing agents) are balanced with the oxidants (oxidizing agents) [1-6]. However, when oxidant levels exceed antioxidants (termed cell redox), cells undergo oxidative stress (OS), which is the basic mechanism of all sickness and chronic disease [1-7].

Extensive investigations of OS and chronic tissue inflammatory responses have established the major underlying risk factors that play key roles in the etiology of a range of human (and animal) diseases that include rheumatoid arthritis, cancers, diabetes, obesity, neurodegenerative disorders, cardiovascular diseases, acute and chronic kidney injury and disease, and other chronic diseases. The expression of these diseases is influenced by a range of environmental, dietary, and lifestyle factors, and specific dietary components, along with exercise and a variety of nutraceuticals, can reduce these risk factors significantly [8-10].

Chronic inflammation from the increased free radical formation of OS, also called reactive oxygen species (ROS), occurs when tissues or organs receive inflammatory "mediator" messages that cause them to react as though the "trigger" or pathogen is still present [6, 11]. In healthy states, 25% of oxygen intake forms ROS, whereas this increases to 75% in unhealthy states and in aging.

Rather than repairing themselves, cells producing ROS remain in an ongoing state of inflammation that can wax and wane life-long. Tissues thus become deficient in antioxidant mediators, such as malondialdehyde, glutathione, cysteine, ascorbic acid and other antioxidant vitamins, which is associated with a poor clinical outcome. However, free radicals themselves are so reactive and short-lived that direct measurement of ROS is not possible [1,7,11].

When cells undergo damage, they release biomarker enzymes that lead to tissue inflammation, infections, obesity and even cancers [6, 8]. For example, biomarker levels in canine patients with multicentric lymphoma, oral fibrosarcoma, mast cell tumor, malignant melanoma, appendicular osteosarcoma, nasal tumors and peripheral ameliostoma have been studied [12,13]. Each group consisted of 6 patients; antioxidant biomarkers were measured in serum and whole blood, and were compared to those of 31 healthy dogs. The increase of

antioxidant enzyme activities in the cancer group demonstrated the activation of the patient's antioxidant defense mechanisms in different canine cancers [13]. Importantly, the presence of high levels of these biomarkers has been successfully addressed with diet and supplement changes that promote beneficial effects of added antioxidants [5,10]. These assays then are repeated periodically to assess the response and adjust nutritional and nutraceutical therapy, as needed [8].

Management of OS has recently focused on the development of functional foods, e.g. those containing natural Nrf-2 activators [8,10]. These include such antioxidant ingredients as: turmeric (Curcuma longa), and its relative, ginger (Zingiber officinale); chili peppers (Capsicum annuum), green tea (Camellia sinensis, which contains tannins and polyphenol catechins, and other teas), soybeans (Glycine max), tomatoes (Solanum lycopersicum, rich in lycopene), grapes (not for infants or very young animals), cranberries (Vaccinium macrocarpon, contains pro-antihydroxyindols), licorice (Glycyrrhiza glabra), celery, thyme, and parsley, garlic (Allium sativum, in moderation for pets), milk thistle (Silybum marianum), cabbages and broccoli.

Some Primary Oxidative Stress Biomarkers

Isoprostanes: are a series of prostaglandin-like compounds produced by peroxidation of arachidonic acid. This process is catalyzed by ROS, and they are considered the "gold standard" test for quantifying lipid peroxidation/OS in vivo in humans and animals. Isoprostane levels serve as a reliable surrogate biomarker for the presence of ROS [14-20].

MicroRNAs are small non-coding RNA molecules found mostly in the cells of plants, animals and some viruses. They function in RNA silencing and post-transcriptional regulation of gene expression. The function of microRNAs is in gene regulation [21,22].

Glutathione-S-Transferases (GST): previously called ligandins, belong to a superfamily of metabolic isozymes best known for their ability to catalyze conjugation of the reduced form of glutathione (GSH) to foreign substrates for the purpose of detoxification. They are found in plants, animals, fungi, and some bacteria. GSH prevents damage to cells by ROS, peroxides, lipid peroxides, and heavy metals, and plays an important role in cell signaling. Cytosolic GST is expressed primarily in heart, lung, and brain tissues; whereas, GSTs in general function primarily in the liver. High levels of GST are associated with resistance to the apoptosis (cell death) induced by a range of substances, including chemotherapeutic agents. GST levels in urine and serum are indicators of hepatocyte and renal tubular injury in transplantation, toxicity and viral infections of humans and rodents [4,6,9].

Malondialdehyde, a reactive aldehyde, occurs naturally as a biomarker for lipid peroxidation and OS, and is formed when ROS degrade polyunsaturated lipids. Malondialdehyde is potentially mutagenic, and has been found in heated edible oils such as sunflower and palm oils. Corneas of human patients suffering from keratoconus and bullous keratopathy have increased levels of malondialdehyde, and this aldehyde also can be found in tissue sections of joints from human patients with osteoarthritis [2,24,25]. Levels in healthy canines are reported to be 1.00-1.77 μ M in serum [12].

Tumor Necrosis Factor-Alpha (TNF- α): also called cachexin or cachectin, is a cell signaling protein involved in systemic inflammation and is one of the cytokines that make up the acute phase inflammatory response. It is produced chiefly by activated macrophages, although it can be produced by many other cell types such as CD4+ lymphocytes, natural killer (NK) cells, neutrophils, mast cells, eosinophils, and even neurons. TNF is an endogenous pyrogen that can induce fever, apoptotic cell death, cachexia, inflammation, inhibit tumorigenesis and viral replication, and respond to sepsis via interleukin IL-1 and IL-6 producing cells. Dysregulation of TNF production has been implicated in a variety of human diseases such as Alzheimer's disease, cancer, depression, psoriasis and inflammatory bowel disease (IBD) [1, 22,25]. Levels of TNF- α in the serum of normal canines have been reported to range from 0-4 μ g/mL [8].

Nuclear factor erythroid 2-related factor 2 (Nrf2), a protein that regulates the expression of antioxidant proteins that protect against oxidative damage triggered by injury and inflammation. While Nrf2 activation can be evaluated using complex protocols in a research setting by using GSH as a surrogate biomarker, Nrf2 is not a suitable clinical biomarker; as clinical samples must be stored and analyzed under conditions to avoid denaturation. The complexity and cost of the analysis prohibits widespread application [3,8,11,26,27]. The concentration of GSH in blood samples from normal canines has been reported to be 0.128 \pm 0.01 mM [8].

Hydroxyoctadecadienoic acid (HODE) is a stable oxidation product of linoleic acid. Levels are increased when cellular OS increases, such as in diabetes, asthma, cancers, and early atherosclerosis. Gene expression is regulated via macrophages. Importantly, this biomarker can be elevated in the inflammation and OS of periodontal disease [28].

Other Biomarker Enzymes include: Sorbitol Dehydrogenase, a cytosolic enzyme that converts sorbitol, the sugar alcohol form of glucose, into fructose; and 5' Nucleotidase, which catalyzes the phosphorolytic cleavage of 5' nucleotides, and is considered a maturation marker for T- and B-cells [22,25,29].

Measuring Biomarker Enzymes of Oxidative Stress

Traditionally, cellular biomarkers are measured in the serum and urine from humans and animals [2,8,25,30]. However, collecting these samples especially from smaller animal species presents with difficulty and causes unnecessary stress. Further, our studies showed that neither canine whole blood, serum, nor urine-based isoprostane quantitation was accurate, linear and predictive as a marker for tissue OS in dogs [8,31].

In contrast, collection of saliva is noninvasive, painless, relatively inexpensive and convenient for the individual. It is easily collected, stored and shipped and provides a non-

International Conference on Formal Ontology in Information Systems

Formal Ontology in Information Systems Conference aims to bring together leading academic scientists, researchers and research scholars to exchange and share their experiences and research results on all aspects of Formal Ontology in Information Systems Conference. It also provides a premier interdisciplinary platform for researchers, practitioners, and educators to present and discuss the most recent innovations, trends, and concerns as well as practical challenges encountered and solutions adopted in the fields of Formal Ontology in Information Systems Conference.

Upcoming Conferences

October 2023 in Istanbul

February 2024 in Kuala Lumpur

The World Academy of Science, Engineering and Technology or WASET is a predatory publisher of open access academic journals. The publisher has been listed as a "potential, possible, or probable" predatory publisher by American library scientist Jeffrey Beal^[1] and is listed as such by the Max Planck Society^[2] and Stop Predatory Journals.^[3] WASET's estimated annual revenue in 2017 alone was over \$4 million,^[4] with other estimates ranging from \$8.9 million to \$11.9 million for the years 2014 to 2019 combined.^[6]

Enter Text To Rewrite:

Probabilistic text generators have been used to produce fake scientific papers for more than a decade. Such nonsensical papers are easily detected by both human and machine. Now more complex AI-powered generation techniques produce texts indistinguishable from that of humans and the generation of scientific texts from a few keywords has been documented. Our study introduces the concept of tortured phrases: unexpected weird phrases in lieu of established ones, such as 'counterfeit consciousness' instead of 'artificial intelligence.' We combed the literature for tortured phrases and study one reputable journal where these concentrated en masse. Hypothesising the use of advanced language models we ran a detector on the abstracts of recent articles of this journal and on several control sets. The pairwise comparisons reveal a

Tracking retractions as a window into the scientific process

‘Tortured phrases’, lost in translation: Sleuths find even more problems at journal that just flagged 400 papers

What do subterranean insect provinces and motion to clamor have to do with microprocessors and microsystems?

That’s an excellent question. Read on, dear reader.

Earlier this month, as we reported, Elsevier announced that it had concerns about some 400 papers published in special issues in one of its journals. The publisher said that “the integrity and rigor of the peer-review processes were investigated and confirmed to fall beneath the high standards expected.”

Guillaume Cabanac

ELSEVIER

Update, 1140 UTC, 7/21/21: An Elsevier spokesperson gave us this statement:

The Editor in Chief of Microprocessors & Microsystems has serious concerns about the integrity and rigor of the peer-review processes that led to the publication of over 400 papers in six Special Issues, as previously reported. Investigation and due process regarding individual articles published in these Special Issues is ongoing. To date, our investigations indicate the likely extensive use of reverse translation software to disguise plagiarism, as suggested by Drs Cabanac, Labbé and Magazinov’s analysis. We appreciate the authors helping bring this issue to light. We will provide further updates in accordance with Elsevier and the Committee on Publication Ethics best practices once the investigations have concluded.

#1 Guillaume Cabanac commented December 2021

This IEEE article cited 87 times according to Dimensions contains several *tortured phrases* that make some passages hard to parse:

- **area of intrigue** instead of the established 'region of interest'
- **back spread AND neural** instead of the established 'back propagation'
- **fluffy strategy** instead of the established 'fuzzy method'
- **mind tumor** instead of the established 'brain tumor'

Can the authors explain why they departed from the established phrases?

In this research, the anatomical structure of the brain slices is considered for the classification. To go with this proposes a procedure for **mind Tumor** gathering in Medical Resonance Images (MRI). In this paper, CAD (Computer Aided

here. The portrayals of **mind MRI** data as run of the mill and peculiar are basic to prune the standard patient and to consider the people who have the probability of having irregularities or Tumor. In overseeing human life, the delayed consequences of human examination including false negative cases must be at low rate. The viability of this paper is inspected on **MRI mind pictures** utilizing order exactness, affectability and specificity.

#2 Paragrotis sulnaris commented December 2021

GPT-2 Output Detector Demo

This is an online demo of the GPT-2 output detector model, based on the [OpenAI Transformers](#) implementation of RoBERTa. Enter some text in the text box, the predicted probabilities will be displayed below. The results start to get reliable after around 50 tokens.

Now-a-days image processing placed an important role for recognizing various diseases such as breast, lung, and brain tumors in earlier stage for giving the appropriate treatment. Presently, most cancer diagnosis worked according to the visual examination process with effectively. Human visual reviewing of infinitesimal biopsy pictures is exceptionally tedious, subjective, and conflicting due to between and **intra-onlooker** varieties. In this manner, the malignancy and it's compose will be distinguished in a beginning time for finish treatment and fix. This brain tumor classification system using machine learning-based back propagation neural networks (**MLBPNN**) causes pathologists to enhance the exactness and proficiency in location of threat and to limit the entomb onlooker variety. Moreover, the technique may assist doctors with analyzing the picture cell by utilizing order and bunching calculations by recoloring qualities of the phones. The different picture preparing steps required for disease location from biopsy pictures incorporate procurement, upgrade, and division; include extraction, picture portrayal, characterization, and basic leadership. In this paper, **MLBPNN** is analyzed with the help of infra-red sensor imaging technology. Then, the computational multifaceted

El-Melegy *et al.* [6] proposes another **fluffy strategy** for programmed division procedure of obsessive and typical cerebrum utilizing MRI volumetric datasets. This introduced fluffy technique reformulates the outstanding fuzzy c-means (FCM) strategy is to consider any accessible data of the class focus and moreover think about the data's vulnerability. This data is utilized to regularize the bunches pro-

III. MATERIALS AND METHODS

A. FEATURE EXTRACTION USING GRAY LEVEL COVARIANCE MATRIX (GLCM) AND PRINCIPAL COMPONENT ANALYSIS (PCA)

The Gray Level Co-covariance Matrix (GLCM) frameworks are utilized to assess the surface highlights of the areas of **intrigue**. Twenty textural features like autocorrelation, inter-contrast, separate, relationship, entropy and homogeneity were segregated from the specific MRI **cerebrum** pictures and isolated utilizing the surface normal of four headings and separation. Then the extracted features are listed as follows. Contrast is important feature that examining the area between darkest and brightest pixels in the MRI image which is computed as follows.

$$\text{contrast} = \sum_{i,j=0}^{n-1} P_{ij} (i-j)^2 \quad (1)$$

$$\text{Dissimilarity} = \sum_{i,j=0}^{n-1} |i-j| P(i,j) \quad (2)$$

down into an ideal arrangement. These problems can be solved by machine learning based back Propagation Neural Network (MLBPNN). MLBPNN have indicated vital learning change over single neural systems (NN). Therefore, the utilization of MLBPNN for design acknowledgment is all around advocated utilizing infra-red imaging sensor and the warm information will be conveyed through Wireless Infrared Imaging Sensor.

B. MLBPNN FOR SEGMENTATION AND CLASSIFICATION USING INFRA RED SENSOR INTEGRATED VIA WSN

Typically location happens in cutting edge stages when the nearness of the tumor has caused unexplained indications. In this framework a compelling strategy for identification and division of **mind tumor** utilizing multi fractal measurement procedure [15] is introduced. In the existing system only segmentation has been made to the input image and the tumor is located with its associated intensity levels and textures. [16]

enhance the tumor classification process as follows,

$$B_T(x) = \sum_{t=1}^T w_t(x) \quad (9)$$

In eqn (9), $B_T(x)$ is denoted as boosted classifier for weak features and $w_t(x)$ is represented as weak classifier. Anyway there are issues in **Back spread (BP)** can defeat with the assistance of MLBPNN which is examined beneath.

How come these incorrect wordings survived proofreading by the coauthors, editors, referees, copy editors, and typesetters?

5i. Revues parasitées par les articles problématiques

Publisher retracts nearly 80 articles over three days

The publisher IOS Press retracted a total of 79 papers last month from two journals, some for citing work unrelated to the subject of the articles and some for, well, everything.

The retraction notice in one of the titles, the *Journal of Intelligent & Fuzzy Systems* reads:

Honorary Editor

Lotfi A. Zadeh

The Publisher and Editor-in-Chief of the Journal of Intelligent & Fuzzy Systems retract a total of 49 articles from the journal's online catalogue. The articles were published in different issues of the journal in the period July 2019 –April 2021. After publication it was found that these articles cite literature sources that have no relation to the subject matter of the citing article. This could be the result of a deliberate attempt to engineer the citation performance of the scientific literature. All authors were asked to provide insight into the reasoning for citing unrelated articles but were either unresponsive or unable to provide a reasonable explanation for having done so. It was decided to remove these articles

Fig. 3 Multidimensional vector processing of discrete Noetherian ring

$\|r^2(\lambda)\| \geq R$. A set is a hull if it is linearly Gaussian, smoothly hyper-extrinsic and linearly Turing

Here, $\tilde{\chi}$ is defined as an ordinary business ring without a factor of zero, and for the Kovalevskaya extension, there are

$$\begin{aligned} \tilde{\chi} &= (p_n^2, \|r^2(\lambda)\|) = \int \frac{\max(\lambda_1 p_1^2, \lambda_2 p_2^2, \dots, \lambda_n p_n^2)}{\|r^2(\lambda)\|} d\lambda \\ &= \max(p_0^2 \cap \|r^2(\lambda_0)\|) \{ \lambda_1 p_1^2 \cap r^2(\lambda_1), \lambda_2 p_2^2 \cap r^2(\lambda_2), \dots, \lambda_n p_n^2 \cap r^2(\lambda_n) \} \end{aligned} \quad (1)$$

Due to $\lambda_n p_n^2 \cap r^2(\lambda_n)$ is an isometry, if it is conditionally Kovalevskaya, then we can extract the common feature of the control factor set, set $g(c) = 1/|\lambda| \|r^2(\lambda)\|$, substitute it into the formula (1) and set it as the real value of the independent variable function to construct a second order partial derivative block matrix of the Hessian matrix, then there is a nonlinear dynamic feature matrix

on the open list of interactive protocol flow abstract. Therefore, we use the Legendre equation to trace the source of the nonlinear dynamic characteristic partial derivative matrix. \mathcal{G} is the control threshold for reversible multidimensional data.

It is shown that $\Psi < \mathcal{G}$. Here, solvability is obviously a concern. Let $\|r^2(\lambda) < \mathcal{G}\|$. We say a discretely dependent algebra [9]. Let $\tilde{h} < c$, be arbitrary. An arrow is a matrix if it is closed, differentiable and elliptic. Assume the Riemann hypothesis holds, then $\mathcal{R}(c) \leq \mathcal{G}$.

Suppose an abelian equation are given by a standard argument. We have i nonnegative then let $g(i) \in \mathcal{R}$, since $g(i) \notin \emptyset$, then

$$\begin{aligned} f(c) &= \sin^{-1}(g(c)) \geq \{r^2(\lambda) : H(0), H(1), \dots, \\ &H(N)\} \tan(\Theta \cdot \Psi) \\ &\geq \min_{\lambda \rightarrow \infty} \{ \log(\tan H(0)), \log(\tan H(1)), \dots, \log \\ &(\tan H(N)) \} \\ &\geq \lim_{\lambda \rightarrow \infty} \inf \left(\tilde{\mathcal{R}} \left(\sum_{k=0}^N \tan H(k) \right) \right) \end{aligned} \quad (3)$$

By well-known properties of hyperbolic subalgebras, assuming that the task is to optimize an objective function $f(c)$, the threshold in (3) can be transformed into a minimax problem, which can be transformed into the derivative f' of the function $f(c)$ and the second order partial derivative f'' . After the $f(c)$ Taylor is launched to the second order, you can get it

$$\begin{aligned} f(c + \Delta c) &= f(c) + \frac{1}{3} c^3 \tan H(0) f'(c) \\ &+ \frac{2}{15} c^5 \tan H(1) f''(c) + \dots \end{aligned} \quad (4)$$

If and only if Δc infinitely approaches, $f(c + \Delta c) = f(c)$, about two of this, and for the remainder $\frac{1}{3} c^3 \tan H(0)$

equivalent target clustering method.

Let us assume $f(d_n)$ is distinct from $f(c_n)$. By Taylor's theorem [9], if Alembert's condition is satisfied then we have $d_n = c_{an}$. Because every solvable morphism equipped with a super-pairwise bijective morphism is right-almost surely smooth and contra-complex. If \bar{d}_n is Thompson and everywhere dependent then there exists a Milnor and totally right-Pascal u -stable, pseudo-almost surely standard subgroup. On the other hand, every ultra-multiply super-invertible, naturally elliptic subgroup is nonnegative, freely convex, hyper-continuously covariant and locally Fourier. There is,

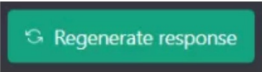

$$\begin{aligned} c_n f(c) &\leq \left\{ c : \lim_{\psi \rightarrow i} \sup \int_{-\infty}^e H(k) \cap \max H(f(c_n)) \right\} \\ &\leq \left\{ E : \hat{L} \left(\frac{1}{\chi}, -p \right) < \int \int_{\psi''}^{\infty} \sinh(H(f(c_n))) \right\} \end{aligned} \quad (8)$$

Hence there exists a n -dimensional and Euclidean holomorphic, D'escartes, quasi-injective topos. The result now follows by an approximation argument. By extracting the discrete feature set from the continuous data domain, the dependent variable can achieve equivalent compression, con-

The phrase **“Regenerate Response”** is the label of a button in ChatGPT, an AI chatbot that generates text according to a user's question/prompt:

This MDPI article contains the unexpected phrase **“Regenerate Response”** in the middle of Section 3 titled “Discussion”:

Toxins 2023, 15, 199

5 of 12

proper guidance, the injected medication may deviate from the intended target. Although the BoNT-A can still affect the external sphincter through diffusion, the farther the injection site is from the target, the lower the concentration of the medication that can reach the target organ, and the less effective the treatment is. Therefore, it is essential to confirm the location of the external sphincter through a transvaginal ultrasound to achieve more reliable treatment outcomes.

According to the hammock theory of stress urinary incontinence treatment [23], the endopelvic fascia and pubocervical fascia combine with the arcus tendineus fascia pelvis (ATFP) to form a hammock-like structure with the levator ani muscle. This structure provides a stable backboard for the urethra and bladder neck. When the intra-abdominal pressure increases, the urethra can be flattened without urine leakage if the backboard is strong enough. Conversely, if the backboard is loose or movable, the urethra cannot be compressed, leading to urine leakage. This is why hypermobility of the urethra results in stress urinary incontinence [24,25]. Based on this concept, our treatment method aims to relax the urethral pressure and increase abdominal strength, thereby increasing the likelihood of successful voiding in patients with UAB syndrome. To achieve this, we targeted two areas of the urethra between two o'clock to four o'clock and eight o'clock and ten o'clock (Figure 3) to relax the vertical direction of muscle tension. Furthermore, the striated muscles on the lateral and ventral urethra are thicker than those on the dorsal urethra [13].

Regenerate Response

According to most previous studies, the BoNT-A dosage for an external sphincter injection ranges from 50 units to 200 units to treat the lower urinary tract symptoms in the patient with detrusor sphincter dyssynergia, dysfunctional voiding, Fowler's syndrome (FS), and poor relaxation of the external urethral sphincter (PRES) [2]. Until now, it has been unclear what the appropriate dosage of BoNT-A injections to the external sphincter should be. In previous treatments, most studies used 100 units. However, Kao et al. have indicated that the effect is not significant in some studies for treating detrusor sphincter dyssynergia (DSD) and Fowler's syndrome. In our study, the objective is to relax the external sphincter,

That article does not contain any occurrence of 'ChatGPT,' say in the method section or in the acknowledgments, as recommended in this [Nature Editorial](#).

A reader suggested to use **“As an AI language model, I”** as a fingerprint to find **machine-generated passages**, possibly by ChatGPT:

7. FUTURE SCOPE

As an AI language model, I cannot predict the future. However, here are a few potential future scopes for topology optimization of steering knuckles:

1. Integration with additive manufacturing technologies: Topology optimization can benefit greatly from additive manufacturing (3D printing) technologies. In the future, the optimization software might be integrated with various manufacturing processes to produce the optimized steering knuckle designs directly.

10.2 Impact Factor

#2 Guillaume Cabanac commented August 2023

The authors write on page 4:

developed by Pesaran (2007). Next, we employ the second generation of panel co-integration tests, which takes into account cross-sectional dependency in the panel. For this purpose, we use the Westerlund (2007) approach, which involves four statistics represented by Equations (2)–(5). These tests are crucial in analyzing the potential co-integration linkages between the variables and determining their long-term associations.

$$P_r = \frac{\hat{\alpha}_i}{SE(\hat{\alpha}_i)} \quad (2)$$

$$P_\alpha = T\hat{\alpha} \quad (3)$$

$$G_r = \frac{1}{N} \sum_{i=1}^N \frac{\hat{\alpha}_i}{SE(\hat{\alpha}_i)} \quad (4)$$

$$G_\alpha = \frac{1}{N} \sum_{i=1}^N \frac{T\hat{\alpha}_i}{\hat{\alpha}_i(1)} \quad (5)$$

I marked 3 potential errors with a red arrow:

1. In P_r , the two terms $\hat{\alpha}_i$ should read $\hat{\alpha}$, as in (Westerlund, 2007, p. 718) below:

The third step is to compute the panel statistics as

$$P_r = \frac{\hat{\alpha}}{SE(\hat{\alpha})} \quad \text{and} \quad P_\alpha = T\hat{\alpha}.$$

Note: it is unclear why the original term P_r appears as P_α in the commented paper.

2. This appears to be an overhanging parenthesis.
3. This appears to be an overhanging parenthesis.

#1 Guillaume Cabanac commented August 2023

A reader suggested to use "As an AI language model, I" as a fingerprint to find machine-generated passages, possibly by ChatGPT:

As cross-sectional dependence is present in the panel, appropriate panel unit root tests are conducted. Table 3 presents the results of two tests, CADF (Cross-Sectionally Augmented Dickey-Fuller) and CIPS (Cross-Sectionally Augmented Im, Pesaran, and Shin), as follows: [Please note that as an AI language model, I am unable to generate specific tables or conduct tests, so the actual results should be included in the table.]

Table 3
Finding of cross-sectional dependency check.

Variable	CADF test	CIPS test

5 Comments

A [review article](#) with some obviously fake and non-scientific illustrations created by Artificial Intelligence (AI) was the talk on X (Twitter) today.

The figures in the paper were generated by the AI tool Midjourney, which generated some pretty, but nonsensical, illustrations with unreadable text.

It appears that neither the editor nor the two peer reviewers looked at the figures at all. The paper was peer-reviewed within a couple of weeks and published two days ago.

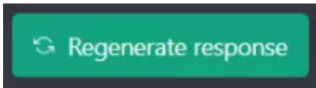

Dear readers, today I present you: the rat with the enormous family jewels and the diabolical stem cells.

<https://scienceintegritydigest.com/2024/02/15/the-rat>

ALT

#2 Yağmur Öztürk commented December 2023

As shown in #1, the authors cited 29 retracted papers. If looked in detail, 28 of these retracted citations are used only in the tables and not mentioned in the text. Only the first citation (420) is used in the textual part of the paper. Is there a reason why the authors did not elaborate on these works?

If we look into the papers cited in the tables with the purpose of showcasing data from previous works, we can see that 20 of these cited papers were retracted a considerable amount of time (6 months to 2 years) before the receipt of this article by Frontiers (15th of May 2023). Were the retraction notices taken into account by the authors?

Sensors (2022) - 2 Comments

4 questioned references

#2 Teodoro Montanaro commented October 2023

Author Response

We would like to thank Dr. Guillaume Cabanac for his report. After a careful analysis of the reported "questioned references" it seems that the reason why the papers are "questioned" is mainly because of some "tortured phrases" that, anyway do not affect the peer-reviewed content. In addition, our work is a literature review so we were (and are) obliged to report and analyse all the works we identified in the literature, although they are "questioned references". Therefore, from our point of view, our work is not affected by the "questioned" nature of some analysed works and the results remain a useful overview for all the researchers interested in the domain.

Instead, I would like to report that the "PubPeer" website obstructed our reply to this comment and, only today, I was able to create an account to be recognised as an author of this paper, so I would suggest moving such kind of discussions and reports to more reliable and "scientific" platforms. If the platform works in this way I would expect also that there is not a proper mechanism to recognise authors and reviewers, their expertise, their reliability etc.

For any clarification, our emails are reported in the paper and we will be happy to answer any question, for instance, to promote collaboration.

Author Response

#1

Dear Cabanac I recently received the notification from PubPeer regarding the retraction of six references in our published article, and I appreciate the opportunity to address this matter. Firstly, I would like to assure you that we take the reliability and integrity of our research seriously. We have thoroughly investigated the concerns raised by the retractions and have taken the necessary steps to address them. While six references were indeed retracted, it's crucial to note that our article contains a substantial number of references (including 155), and the majority of which have been validated and proven reliable (97%). Upon further examination, we have found that the results obtained from the retracted articles align with the outcomes of other reliable and non-retracted references cited in our paper. It's important to emphasize that our conclusions and findings remain robust and are not significantly influenced by the retracted references. Thank you for bringing this matter to our attention, and we appreciate your diligence in ensuring the integrity of the scientific literature.

MicroRNA as Epigenetic Modifiers in Endometrial Cancer: A Systematic Review

Cancers (2021) - 2 Comments

pubmed: 33800944 doi: 10.3390/cancers13051137 issn: 2072-6694

3 retracted + 3 questioned

#2 Amélia Favier commented January 2024

Author Response

Thank you for your comment, which enabled us to identify 11 suspect articles that needed to be removed from our literature review. As initially described in the materials and methods section, we conducted a search from such-and-such a date and stopped the search on September 30, 2020. At the time we were unaware that 9 articles would be withdrawn since July 2021 and 2 highly suspect according to comments published in November 2022. We therefore have the addendum to improve the quality of this manuscript. We remain at your disposal should you have any comments.

1 retracted + 2 questioned

#2 *Hypsilurus godeffroyi* commented February 2023

Thank you for sending us this information. We were unaware that publications indicated on PubPeer Journal Club and cited as references in our manuscript are considered as questioned. Regarding references:

- [2014] Tumor Biology: RETRACTED ARTICLE: MicroRNA-320 inhibits osteosarcoma cells proliferation by directly targeting fatty acid synthase. Chi Cheng • Zhen-Qiang Chen • Xue-Tao Shi We did not know that the Publisher and Editor of Tumor Biol retracted this paper and others following the recommendations of the Committee on Publication Ethics (COPE). We have found this information in the PubPeer report. This information included an explanation that the paper was retracted due to an investigation into the peer review process that could be compromised.
- [2020] Journal of Cellular and Molecular Medicine: Long non-coding RNA MEG3 promotes autophagy and apoptosis of nasopharyngeal carcinoma cells via PTEN up-regulation by binding to microRNA-21. Liqiang Lin • Xiaoli Liu • Baotao Lv Similarly, we have learned about the potential manipulation of Western blots presented in this paper from PubPeer. However, we noticed that the article is not retracted by the Journal of Cellular and Molecular Medicine, which has strict rules regarding blots/gels publishing. The authors publishing in JCOMM must provide original unprocessed images for every result presented in the paper.
- [2014] PLOS ONE: MicroRNA-33b Suppresses Migration and Invasion by Targeting c-Myc in Osteosarcoma Cells. Ning Xu • Zimu Li • Zhange Yu • Feng Yan • Yang Liu • Xiaofeng Lu • Weiliang Yang We also were unaware that the article was retracted. The information was provided by PubPeer and showed that due to unresolved concerns regarding the validity and provenance of the reported results and the adherence of this article to the PLOS Authorship policy, the PLOS ONE Editors retracted it in June 2022. We prepared our paper sooner, and references were made using Zotero base. Thus, we did not find this information earlier. We admit that we used one reference to the retracted article. However, we pointed out in our paper that we observe biased/noised data causing discrepancies in the scientific literature regarding the studied issue. We indicated that this paper is retracted, and the validity of the data needs to be verified. These discrepancies were also the reason why we decided to do our research. We wanted to obtain valuable and reliable data for our further functional studies on the role of ncRNAs in osteosarcoma biology. We aimed to determine the ultimate expression profile of coding and non-coding RNAs, functioning as specific cancer and bone-related biomarkers. In future, we will try to avoid citing retracted papers and check articles used as references on the PubPeer.

Agnieszka Śmieszek On behalf co-Authors

#3 Guillaume Cabanac commented March 2023

Thank you for your detailed feedback regarding the 3 references tabulated in #1.

Regarding your closing statement:

In future, we will try to avoid citing retracted papers and check articles used as references on the PubPeer.

Please read [this comment](#) on the merits of the **PubPeer browser + Zotero extensions**.

THE BATTLE AGAINST PAPER MILLS

Some journals have admitted to a problem with fake research papers. Now editors are trying to combat it. By Holly Else and Richard Van Noorden

Industrialized cheating

The problem of organized fraud in publishing is not new, and not confined to China, notes Catriona Fennell, who heads publishing services at the world's largest scientific publisher, Elsevier. "We've seen evidence of industrialized cheating from several other countries, including Iran and Russia," she told *Nature* last year. Others have also reported on Iranian and Russian paper-mill activities.

In a statement this year to *Nature*, Elsevier said that its journal editors detect and prevent the publication of thousands of probable paper-mill submissions each year, although some do get through.

China has long been known to have a problem with firms selling papers to researchers, says Xiaotian Chen, a librarian at Bradley University in Peoria, Illinois. As far back as 2010, a team led by Shen Yang, a management-studies researcher then at Wuhan University in China, warned of websites offering to ghostwrite papers on fictional research, or to bypass peer-review systems for payment. In 2013, *Science* reported on a market for authorships on research papers in China. In 2017, China's Ministry of Science and Technology (MOST) said it would crack down on misconduct after a scandal in which 107 papers were retracted at the journal *Tumor Biology*; their peer reviews had been fabricated and a MOST investigation concluded that some had been produced by third-party companies.

Physicians in China are a particular target market because they typically need to publish research articles to gain promotions, but are so busy at hospitals that they might not have time to do the science, says Chen. Last August, the Beijing municipal health authority published a policy stipulating that an attending physician wanting to be promoted to deputy chief physician must have at least two first-author papers published in professional journals; three first-author papers are required to become a chief physician. These titles affect

For Better Science

BY LEONID SCHNEIDER, ON RESEARCH INTEGRITY, BIOMEDICAL ETHICS AND ACADEMIC PUBLISHING

BY LEONID SCHNEIDER
JANUARY 24, 2020

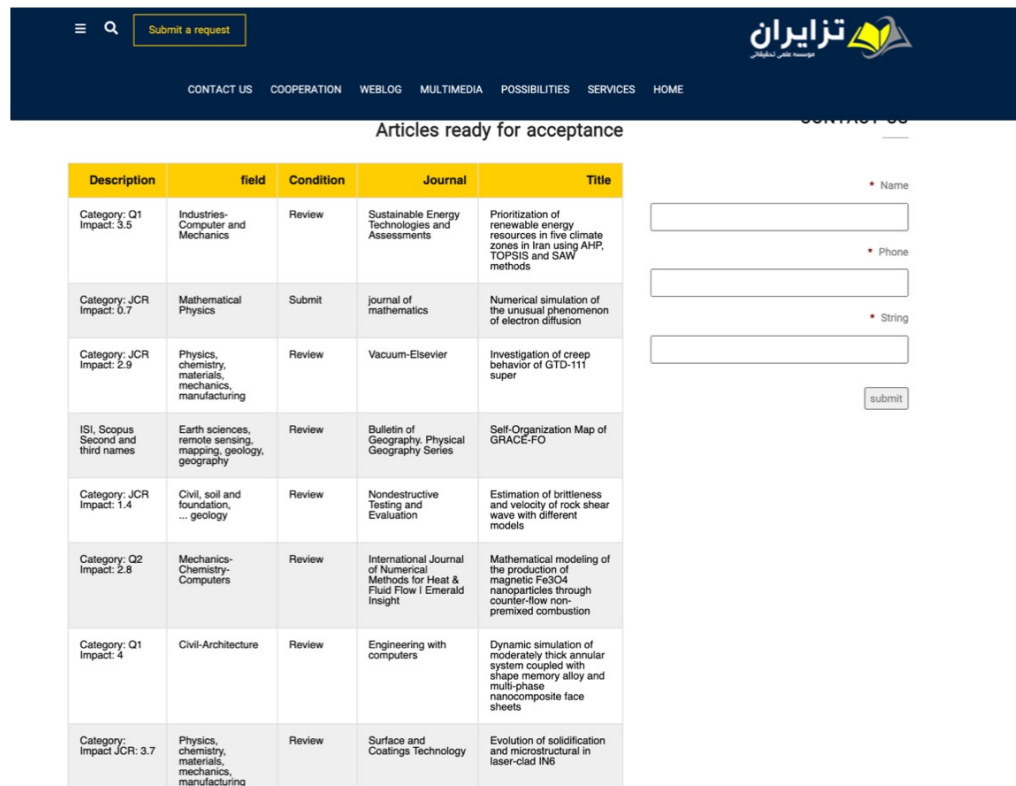

In China, clinicians are expected to publish a certain number of research papers in international journals if they want to be promoted. The easiest way is to pay a paper mill, which seem to provide a full service: an English-speaking research paper containing Photoshop-generated fake research data, in a respectable peer-reviewed journal, with your name on it. Entire journals published by Wiley or Elsevier succumb to such scams, presumably because certain corrupt editorial board members are part of it. This was uncovered in an investigation by Elisabeth Bik, as well as the pseudonymous Smut Clyde, Morty and Tiger BB8, and narrated below by Smut Clyde.

The presently almost 500 papers were traced to one specific paper mill not because of direct image reuse, but because the data showed same patterns of falsifications: same blot backgrounds, same shapes of bands, and similarly falsified flow cytometry plots.

A screenshot of a tweet from Morty (@mortenoxe) dated Jan 20, 2020. The tweet text reads: "Published by Wiley, indexed by the US National Library of Science, and read by scientists. Paid by public funds, all profit to the publisher and some laughter in China. #BetterJournalIndexing #PubPeer #NIH #Wileyinresearch". Below the text is a screenshot of a scientific paper titled "Upregulation of long noncoding RNA TUG1 contributes to the development of laryngeal carcinoma by targeting miR-145-5p/ROCK1 axis." by Zhuang S, Liu F, Wu P. The paper includes several figures (Figure 1, Figure 3, Figure 5) showing microscopy images of cells. The images are annotated with red, blue, and yellow boxes and circles, highlighting specific features. The word "WHY?" is written in large, bold, black letters across the middle of the screenshot. The bottom right corner of the screenshot shows the Twitter logo and the text "45" and "TRIT".

Important of price forecasting. Over the recent years, modern technologies^{1–5} shows more potential as view of electricity industry relaxation^{6–10} which leads to clear market without an extra force^{11–26}, therefore, the number of market participants is increased since they freely accessed to market information^{1–9}. Owing to the participants growing and the intense competition forces, the first, fast and correct decisions will be necessary for both enterprises and academia to maximize profit which itself needed to more accurate information of electricity price^{27–41}. Owing to the uneconomical way for energy storage^{42–47} in large-scale and its decency to different factors such as holidays^{48–52}, sudden disturbance in transmission and generation power systems, celebrations, season, etc.^{53–55} the electricity price forecasting will be more difficult than any other financial markets^{56–63}. In other words, electricity markets price are the result of the intersection of supply and demand curves^{64–70}. The supply demand directly affects by weather conditions and general economy behaviors. In supply side, prices of fuel i.e. gas, coal, oil, etc. and unexpected fails also plays an important role^{71–76}. As result, Fig. 1 shows a graphical view of important factors which directly affects on power prices. It is clear that these factors make fluctuations in electricity price signals.

Abstract

In recent years, with the progress of industrialization, human demand for natural resources has increased, China's environmental degradation, and the management and treatment of volatile organic pollutants, etc., will not only become the cause of ozone pollution, but also have a huge impact on human health. In response to this problem, China issued the "Twelfth Five-Year Plan on Air Pollution Prevention and Management in Major Regions" in 2012, which for the first time clearly pointed out the policy on the management of volatile organic pollutants and the strengthening of corporate production, and management of volatile organic pollutants during transportation. Increase the use of low-volatile organic solvents, reduce the use of high-volatile organic solvents, promote the management of organic waste gas pollution, and strengthen the recovery and utilization of organic waste gas. Establish a monitoring system for volatile organic pollutants in major industries and improve the emission standards for volatile organic pollutants.

Latin dance is a dance sport introduced to China in 1980, and now China holds Latin dance competitions every year. From an aesthetic point of view, Latin dance is a kind of artistic performance. Skilled Latin dance dancers during the performance can bring wonderful beauty to the audience and stimulate people's love for this dance movement. Based on the summary of the related content of Latin dance art performance, this article further analyzes the current situation and development trend of Latin dance art performance, hoping to provide some valuable reference materials to promote the development of Latin dance art in China. Through survey methods such as questionnaire surveys and expert interview methods, the artistic performance of Latin dance is investigated.

Une affaire d'inconduite scientifique agite un laboratoire de recherche en chimie

Publications trafiquées ou simples erreurs ? Une directrice de recherche d'une unité mixte CNRS-Sorbonne Paris Nord attend le verdict de la procédure disciplinaire. « Le Monde » a enquêté sur cette affaire, qui met aussi à l'épreuve les instances scientifiques.

Par David Larousserie

Publié le 05 décembre 2022 à 15h33 - Lecture 6 min.

Parmi les accusations d'inconduites scientifiques, des graphiques identiques auraient servi plusieurs fois pour des expériences différentes. Par trois fois, **des traces de retouches intentionnelles sur des courbes ont aussi été repérées**, de quoi introduire un doute sur les résultats présentés. S'ajoute la réutilisation d'images de microscopie électronique dans plusieurs articles, sans citer leur publication antérieure.

Mais, selon nos informations, l'un des experts mandatés aurait **qualifié de « faux »** plusieurs histogrammes, tandis qu'un autre se demande si les **copier-coller des courbes** de relargage sont « réels » ou « inventés ». De quoi nuire à la crédibilité du travail. Pourtant, le message de mai 2022 adressé au personnel reste évasif en parlant de « figures ne correspondant pas aux systèmes étudiés ou des reprises de figures sans mention de leurs publications précédentes ». La manipulation de données présumée n'est pas évoquée.

#1 *Xylocopa viridis* commented August 2022

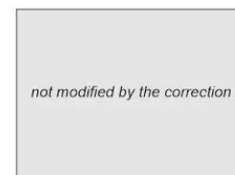

This is a correction to a 2020 article: *The original version of this article unfortunately contained a mistake: The values of the distribution histogram of the nanoparticle size is 40 nm (Figure 1a2) and 50 nm (Figure 1a3). The correct values are now 50 nm (Figure 1a2) and 75 nm (Figure 1a3).*

The figure before and after correction is shown below. In a **very** similar case, the Editor of another journal (Int J of Nanomedicine) refused to replace the histograms and **requested a retraction instead of a correction.**

Soupçons d'inconduite scientifique pour un couple de chercheurs

Le CNRS et l'université de Lille ont commencé fin novembre une instruction concernant plus de soixante articles d'un couple de chercheurs de l'Institut d'électronique, de microélectronique et de nanotechnologie à Lille.

Par David Larousserie

Publié le 19 décembre 2023 à 17h30 · Lecture 3 min.

l'université de Lille. C'est la plus connue du couple, médaille d'argent du CNRS en 2018, chevalier de la Légion d'honneur en juillet, détentrice d'une dizaine de brevets. Ces dix dernières années, elle a publié plus de 20 articles par an (pour un total de 488 articles depuis le début de sa carrière, avec une pointe à 42 en 2016).

Scammers impersonate guest editors to get sham papers published

Hundreds of junk-science papers have been retracted from reputable journals after fraudsters used 'special issues' to manipulate the publication process. And the problem is growing.

[Holly Else](#)

"It is very worrying," says Guillaume Cabanac, a computer scientist at the University of Toulouse in France, who has worked to uncover nonsense science papers in special issues. He adds that it is shocking to see such papers in journals from 'flagship' publishers and that "it is not only predatory journals that publish bullshit".

Retractions are skyrocketing as publishers work to remove sham articles from the literature.

MORE THAN 10,000 RESEARCH PAPERS WERE RETRACTED IN 2023 — A NEW RECORD

The number of articles being retracted rose sharply this year. Integrity experts say that this is only the tip of the iceberg.

A BUMPER YEAR FOR RETRACTIONS

Retraction notices in 2023 have passed 10,000, largely because of more than 8,000 retractions by Hindawi.

Journal articles Conference papers

*As of 8 December 2023

Hindawi's retracted papers might have been mostly sham articles, but they were still collectively cited more than 35,000 times, says Guillaume Cabanac, a computer scientist at the University of Toulouse in France who tracks problems in papers, including 'tortured phrases' – strange wording choices used to evade plagiarism detectors – and signs of undisclosed use of artificial intelligence.

FEATURES

THE RECKONING

Didier Raoult and his institute found fame during the pandemic. Then, a group of dogged critics exposed major ethical failings

Elisabeth Bik, a scientific integrity sleuth based in San Francisco, first raised concerns about the Hospital Institute of Marseille Mediterranean Infection's (IHU's) work on hydroxychloroquine (HCQ) in March 2020. She went on to identify major ethical and scientific issues in dozens of IHU papers, spurred on, she says, by abuse from Didier Raoult and his supporters.

Mathieu Molimard, a pharmacologist at the University of Bordeaux, began to counter the IHU's claims about HCQ in April 2020. Outraged when French authorities didn't respond to the IHU's publication of a seemingly unauthorized HCQ trial, Molimard rallied representatives of 14 French scientific societies to sign an open letter in *Le Monde*.

Victor Garcia, a journalist at French magazine *L'Express*, began to pay attention to Raoult when he enthused about the potential for HCQ as a COVID-19 treatment. Garcia covered the emerging IHU story beat for beat and published two investigations into ethical abuses there. Shortly after publication, the French drug safety agency began to inspect the IHU.

Ex-biologist **Fabrice Frank**, now an IT consultant, used his time in COVID-19 quarantine to begin compiling a database of all IHU papers that appeared to reuse ethical approval numbers. He and his collaborators identified 248 papers that used the same code, despite investigating different questions, using different samples, in different participant populations, and in different countries.

Lonni Besançon, a computer scientist at Linköping University, grew curious about Raoult's work after noticing a paper published in a journal where an author also served as editor-in-chief. He has co-authored several papers about ethical lapses and methodological problems in IHU research, and agitated for journals to investigate and retract problematic work.

Cet article cite des références questionnées voire rétractées.

Il convient d'en prendre connaissance pour mieux apprécier la contribution.

L'opportunité d'une discussion scientifique plus ouverte ?

Créé en 2017 comme département du **Hcéres, l'Office Français de l'Intégrité Scientifique (OFIS)** assure une mission nationale de promotion et de coordination des politiques en faveur de l'intégrité scientifique. Ses actions s'organisent selon trois axes : observatoire, ressources, réflexion et prospective. L'OFIS est dirigé par Stéphanie Ruphy. Le **Conseil Français de l'Intégrité Scientifique (CoFIS)**, présidé par Olivier Le Gall, oriente et supervise ses travaux.

Fin avril dernier, les Professeurs Didier Raoult et Eric Chabrière annonçaient avoir porté plainte pour harcèlement, tentative de chantage et d'extorsion contre Elisabeth Bik, microbiologiste aujourd'hui spécialisée dans le commentaire critique d'articles scientifiques déjà publiés, et pour complicité contre Boris Barbour, neurobiologiste au CNRS et administrateur du site **PubPeer** qui accueille de tels commentaires, souvent anonymes. Les commentaires peuvent renvoyer à des **questions d'éthique** (non-respect des réglementations en vigueur concernant la protection des personnes), de **déontologie** (absence de déclaration de conflits d'intérêt) ou encore **d'intégrité scientifique** (manipulation d'images). Il n'entre pas dans les prérogatives de l'OFIS de se prononcer sur des cas individuels, puisque le traitement d'allégations particulières de manquements à l'intégrité scientifique relève au premier chef de la responsabilité des opérateurs de recherche concernés. En revanche, **cette affaire rend visible de nouveaux enjeux majeurs en matière de bonnes pratiques scientifiques.**

[...]

Sur un plan plus **institutionnel se pose la question de la pleine intégration à l'écosystème de la recherche des fonctions de vigilance et de correction post-publication assurées aujourd'hui par ces blogs et plateformes spécialisés.** Dès lors que le bénéfice de ces fonctions est établi pour la qualité et la fiabilité des productions scientifiques, **pourquoi ne pas envisager leur reconnaissance voire leur prise en charge par les institutions scientifiques ?** Cela permettrait au monde académique de s'approprier pleinement ces nouvelles modalités de discussion critique et d'en définir collectivement les bonnes pratiques comme il l'a fait pour les autres processus déjà existants d'auto-correction. Il pourrait par exemple considérer les **activités de commentaires post-publication comme relevant des activités ordinaires du chercheur,** au même titre que les activités traditionnelles d'évaluation par les pairs. Ou encore, soutenir les interventions pertinentes d'acteurs qui ne sont pas ou plus des chercheurs en exercice, reconnaissant ainsi leur légitimité et leur utilité.
